Sarah,

I worked on this project from 2006-2008. Here are some responses to your questions:

1. What were the sample types? Were these grab or composite? If composite, were they flow- or time-composite?

- Grab samples: turbidity, specific conductivity, TSS, TP, SRP, and fecal coliform bacteria
- *In situ* measurements: temperature, pH, DO

2. What was the catchment drainage boundary for the sampled storm drain catchments?
    - I don't see a specific drainage area specified in the QAPP or final report for the storm drain monitoring stations, but here is what was included in the final report regarding the catchment areas:
        - W1: catch basin near the intersection of Avalon Court and Woodlake Road – captures runoff from approximately 8 houses in a cul-de-sac on Avalon Court and runoff from a portion of Hillsdale Road to the north
        - W2: catch basin near the intersection of Brookedge Court and Woodlake Road – captures runoff from approximately 8 houses in a cul-de-sac on Brookedge Court
    - The remaining monitoring stations were located on tributaries to Lake Whatcom and Lake Samish:
        - SB: Silver Beach Creek
        - FIN: Finney Creek
        - BAR: Barnes Creek

I also attached the map showing the W1 and W2 monitoring stations. Hope that helps!

Thanks,

HERRERA
